ABSTRACT

A smart stick concept is devised to provide a smart electronic aid for blind people. Blind and visually impaired find difficulties in detecting obstacles during walking in the street. The system is intended to provide artificial vision and object detection, real time assistance via making use of Arduino UNO.

The main objective of our project is to provide sound based assistance to blind people. The existing devices for the visually impaired only focus on travelling from one location to another. The device is aimed to help visually impaired with the same maneuver as that of sighted people.

A brief study had been carried out to understand various issues related to the project which involves providing a smart electronic aid for blind people to provide artificial vision and object detection, real assistance via GPS module by using Arduino Uno.

Our project mainly focuses on the visually impaired people who cannot walk independently in the environment. The system consists of ultrasonic sensors, and the feedback is received through audio.

The aim of the overall system is to provide a low cost, efficient navigation and obstacle detection aid for blind which gives a sense of artificiality by providing information about the environmental scenario of static and dynamic objects around them, so that they can walk independently.

ACKNOWLEDGEMENT

In these months of engineering our faculty Dr. Phani Kumar Meduri Dept of Mathematics has guided us to achieve a goal and made us capable to complete our Mini Project work successfully. So, we would like to take this chance to thank our project guide, Lab assistants and college with whose support and skill full guidance has made us such as that we would be proud of wherever we go and always be confident in achieving our goals.

Firstly, we would like to give our sincere regards to all our faculty members of the Computer Science and Engineering Department for giving their excellent guidance and giving us the confidence that we can complete this project successfully. All Faculties of CSE branch have shared their valuable ideas and industrial knowledge for this project and that's why we are also thanking them for their help. We are thankful to our project guide Prof. Phani Kumar Meduri. We are thankful that we got the chance to work under his guidelines and our sincere and heartfelt regards to him.

We would also like to give vote of thanks to Prof. Phani Kumar Meduri who has given us permission to carry out this Project work and for providing with the material which initiated our Project work. Finally, last but not the least we are very much thankful to our Team Members, Friends for their kind support.

CHAPTER 1

INTRODUCTION

Smart Blind Stick Using Arduino

Eyesight plays a major role in collecting most of the information from the real world and that information will be processed by the brain, visually impaired people suffer inconveniences in their daily life and social life. Blindness or visual impairment is a condition that affects many people around the world. This condition leads to the loss of the valuable senses of vision. Worldwide there are millions of people who are visually impaired, where many of them are blind. The need for assistive devices was and will be continuous. There is a wide range of navigation systems and tools existing for visually impaired individuals. The blind person truly requires an identifying objects.

Objectives

The main objective of our project is to provide a sound based assistance to blind people. Here we are trying to develop a system that helps blind people to travel independently and works efficiently. Current navigation device for the visually impair focus on travelling from one location to another. Our project focuses on designing a device for blind people that helps them to travel independently and also it must be comfortable to use. The proposed device is used for guiding individuals who are blind or partially sighted. The device used to help blind people to move with the same ease and confidence as a sighted people.

CHAPTER 2

LITERATURE REVIEW

Literature Survey

A literature survey is a proof essay of sorts. It is a study of relevant literature materials in relation to a topic we have been given. For thorough development of the device Smart Stick for Blind using Arduino Uno, we need to go through each and every technical aspect related to it. This chapter provides an introduction to the area of research. A brief Study and Survey has been carried out to understand various issues related to the project which involves providing a smart electronic aid for blind people to provide artificial vision and object detection, real time assistance via using Arduino. Our project mainly focuses on the visually impaired people who cannot walk independently in unfamiliar environments. The main aim of our project is to develop a system that helps blind people to move independently. Smart Stick for the blind stick usually consists of three parts to help people travel with a greater degree of psychological comfort and independence: sensing the immediate environment for obstacles and hazards, providing information to move left and right and orientation during travel.

CHAPTER 3

PROPOSED MODEL

Theoretical Background

The proposed system consists of three main units: Ultrasonic Sensor Unit, Arduino Unit and Audio Conversion part.

Ultrasonic Sensor - High frequency sound wave generated ultrasonic sensors.

The time interval between sending the signal and receiving the echo is calculated by the sensor to determine the distance to an object.

Arduino Unit - This module deals with taking input from the obstacles coming across the way and giving output according to that input using sound notifications.

Voice Command Module - This module deals with giving the instructions to the blind user about the obstacles through buzzer sound.

Components Required-

Ultrasonic Sensor:

The HC-SR04 Ultrasonic Distance Sensor is a sensor used for detecting the distance to an object using sonar.

Arduino UNO:

The Arduino UNO is an open-source microcontroller board based on the Microchip ATmega328P microcontroller and developed by Arduino cc. The board is equipped with sets of digital and analog input/output pins.

Arduino Buzzer:

A piezo buzzer is basically a tiny speaker that you can connect directly to an Arduino; from the Arduino you can make sounds with a buzzer by using tone.

9V Battery -

The battery is used to provide power supply to the system for its operation.

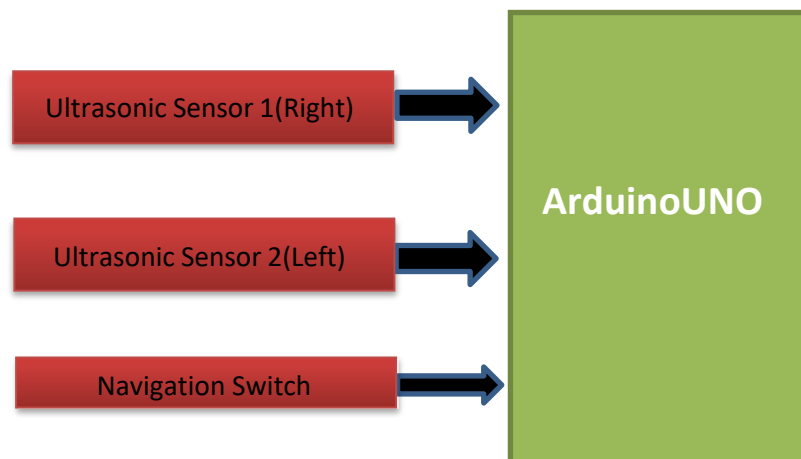

LED:

A light-emitting diode is a semiconductor light source that emits light when current flows through it.

CHAPTER 4

DESIGN PROCESS

Block Diagram of Smart Blind Stick (Transmitter)

Block Diagram of Smart Blind Stick (Receiver)

Code - Arduino for Smart Blind Stick

```
const int trigPin1 = 4;
const int echoPin1 = 5;
const int buzzer = 7;
const int led = 9;

long duration1;

int distance1;

int safetyDistance;

void setup() {
  pinMode(trigPin1, OUTPUT);
  pinMode(echoPin1, INPUT);
  pinMode(buzzer, OUTPUT);
  pinMode(led, OUTPUT);
  Serial.begin(9600);
}

void loop() {
  digitalWrite(led, HIGH);

  digitalWrite(trigPin1, LOW);
  delayMicroseconds(5);

  digitalWrite(trigPin1, HIGH);
  delayMicroseconds(15);

  duration1 = pulseIn(echoPin1, HIGH);

  distance1= duration1*0.034/2;

  if (safetyDistance = distance1){
    if (safetyDistance <= 100){
      digitalWrite(buzzer, HIGH);}
    else{
      digitalWrite(buzzer, LOW);}
  }
}
```

Code Snippets-

Methodology:

The working of the system begins when the power supply is given. The Smart Blind Stick will have an Ultrasonic Sensor, LDR, Arduino UNO, Buzzer.

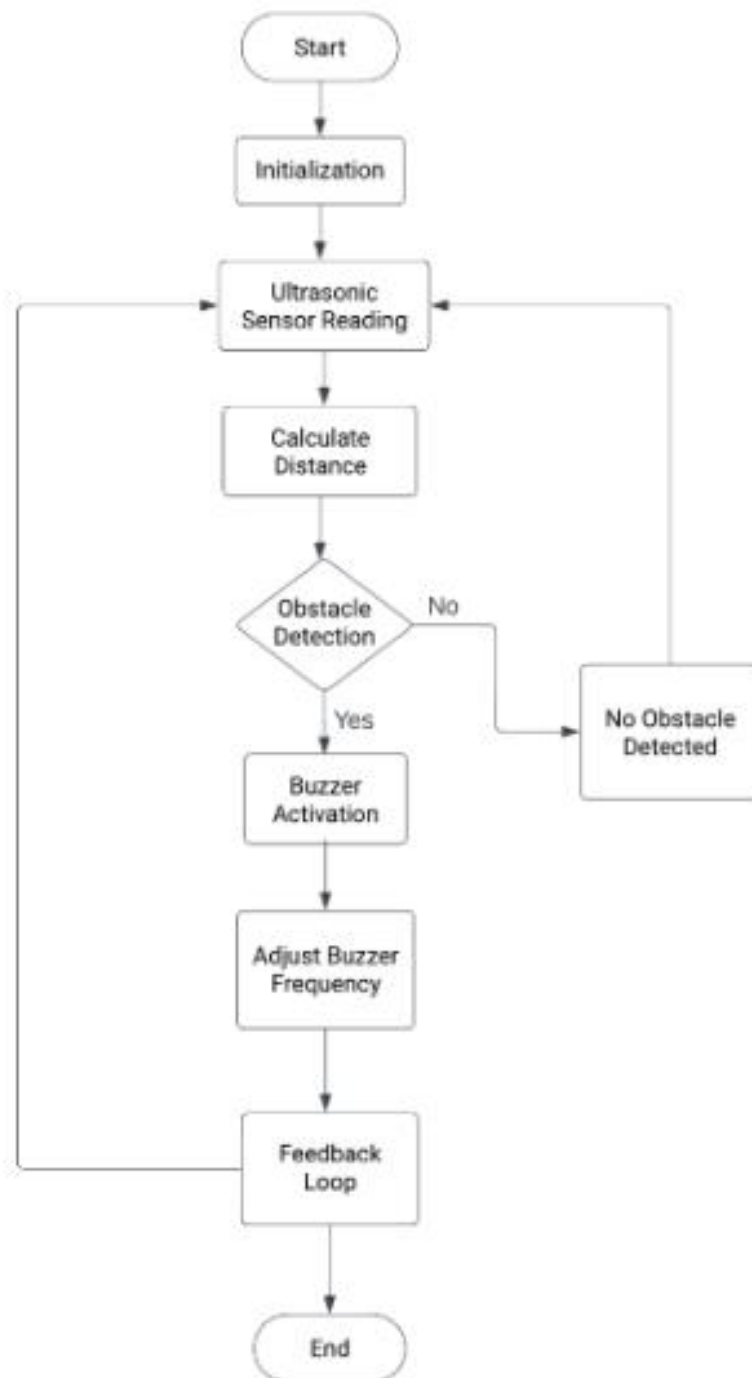

All the components are connected to Arduino UNO for processing.

ADC and DAC take place in the Arduino. Additional navigation efficiency is provided through Buzzer.

Basically, according to the distance assumed in the code, the ultrasonic sensors work according to that and if any obstacles come across then blind stick detects the obstacles as an input function.

Then, after receiving the input from the ultrasonic sensors, it will notify the user by giving the notification in the form of sound.

This sound will be buzzer sound, ensuring the user is notified and saved from the obstacles he/she comes across.

CHAPTER 5

RESULTS AND DISCUSSIONS

Results

The project was made with the working hardware model, detecting the obstacles if come across any obstacles.

The blind stick proposed model can aid the visually impaired user by helping him/her navigate through different terrains and obstacles.

With the advantages, that it is low cost, fast response, low power consumption, light weight and ability receive the feedback through buzzer audio.

Detecting the obstacle with the help of Ultrasonic sensors and it can provide notification to user holding it in the sound form via Arduino buzzer.

Facilitate easier communication in case of emergency.

CHAPTER 6

APPLICATIONS

Applications

It works as a navigation device for the blind people by alerting them about dangers. The system is applied in automotive parking sensors and obstacles warning systems. It is applied during the measurement of object distance.

Robotics barriers. Auto detection.

With little software and sensor up gradation, it can be extensible to any other application and specification.

CHAPTER 7

CONCLUSIONS AND FUTURE SCOPE

Conclusions

The project proposed the design and architecture of a new concept of Smart Electronic Guiding Stick for blind people.

The blind stick proposed in this paper can aid the visually impaired user by helping him/her navigate through different terrains and obstacles.

The advantage of the system lies in the fact that it can prove to be a very low cost solution to millions of blind people worldwide.

The proposed combination of various working units makes a real-time system that monitors position of the user and provides dual feedback making navigation more safe and secure.

It can be further improved to have more decision taking capabilities by employing varied types of sensors and thus could be used for different applications.

It aims to solve the problems faced by the blind people in their daily life. The system also takes measures to ensure their safety.

Future Scope

- In future, we will be modifying the proposed model in better way.
- Initiating with the addition of Bluetooth module for proper on and off functioning.
- Integration of GPS module for detecting location of user, in case of an emergency.
- The GPS module will be integrated in combination of Bluetooth Module of Arduino UNO connecting it to the mobile phone for better and smooth location detection.
- Besides, soil moisture detectors can be implemented for detecting the amount of moisture in the soil, providing the safer access of the path to the user.
- At last, in order to improve the sound notification, we are planning to implement a sound module which will give instruction in voice forms.
- The stick system presented in the paper uses artificial intelligence along with various sensors in real time to help the visually disabled people to navigate their environment independently. Image recognition, collision detection and obstacle detection are the three tasks performed by the system.
